

Agent Operations Framework

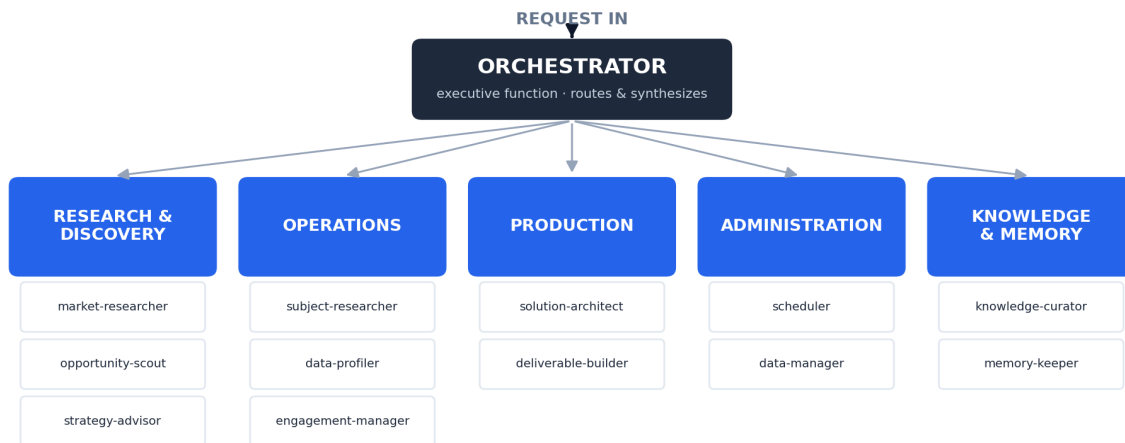

A multi-agent system organized like a company — that extends and improves itself.

The Problem

Complex operational work is done differently by every person, every time. Output is rarely sourced, so no one knows which numbers to trust. And most AI automations are brittle: they break the moment the work changes.

The Approach: a company, not a toolbox

Five specialist departments, twelve agents, an orchestrator as executive function. I had Claude research how high-performing companies organize, then modeled the system on that structure. Every output is tagged Confirmed / Estimated / Missing so a human can trust it at a glance.

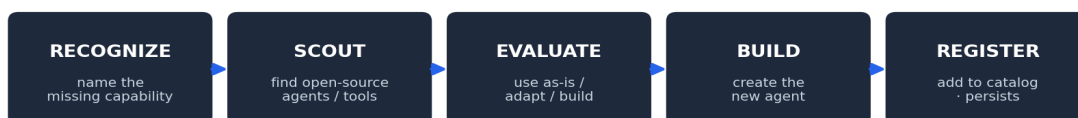

12 specialist agents · each excellent at one job · coordinated like a company

The Differentiator: it grows its own capabilities

Most systems fail when they hit something new. This one runs the **Capability Gap Protocol**: it recognizes the gap, scouts open-source agents and tools, adapts or builds one, and registers it permanently. It came from a real roadblock — my agents kept hitting tasks they could not do as products and customers changed. Instead of babysitting them, I made the system acquire what it lacks.

THE CAPABILITY GAP PROTOCOL

when no agent can do the job, the system grows one instead of failing

the capability is now permanent — the system is better than it was an hour ago

HOW MOST PEOPLE BUILD

ONE AGENT

or a fixed prompt chain

static · breaks when scope changes

needs a human to extend it

THIS SYSTEM

COMPANY OF AGENTS

that extends itself

self-extending · self-improving

grows its own capabilities

That is how I work: when AI hits a wall, I redesign the system around the wall instead of abandoning it.

Proven in Production

The original was built and adopted by a full Solutions Engineering team at a robotics company. This is a clean-room, domain-neutral rebuild — no proprietary content.

Claude · multi-agent orchestration · self-extending architecture
